## **Foreword**

District population projections report for Harare province was prepared using data from the 2017 Inter-Censal Demographic Survey (ICDS). It is the first report to be prepared by the Zimbabwe National Statistics Agency (ZIMSTAT) based on the final results of the 2017 ICDS. In preparing the District Population Projections Report ZIMSTAT seeks to put at the disposal of planners decision makers and development partners reliable data on population dynamics in the two decades: 2012 to 2032.

ZIMSTAT is appreciative of the significant funding and material provisions availed to the Agency by the Government of Zimbabwe given the prevailing budgetary constraints. In addition ZIMSTAT would also like to thank the United Nations Population Fund for the financial, material and technical assistance provided in the production of this report.

**Taguma Mahonde**  
**DIRECTOR-GENERAL**

**3 June 2020**

## **Acknowledgements**

The Zimbabwe National Statistics Agency (ZIMSTAT) would like to extend its appreciation to the United Nations Population Fund (UNFPA) for providing the financial and technical support which enabled the production of this “*District Population Projections Report*”.

Special gratitude goes to ZIMSTAT Population Census and Surveys Division technical staff for producing this report.

## **Executive Summary**

Zimbabwe National Statistics Agency (ZIMSTAT) prepared Harare districts population projections for the period 2012 to 2032. These projections will be used extensively by diverse organizations and agencies in development planning and policy making. The *cohort component method* was utilized for the national level projections while the *ratio method combined with a mathematical approach* was used for sub-national level projections. For the districts projections a new base population based on the adjustment of the 2012 population census data to take into account under-enumeration of population age 0-4 and errors in age-sex composition was established. This report presents the districts population projections which are based on data from the 2017 ICDS and 2012 population census.

## **1. Introduction**

This report presents population projections for 4 census districts of Harare province by age and sex from the base year population of 2012 population census to 2032. These projections are the first to be produced by Zimbabwe National Statistics Agency (ZIMSTAT) following the updated 2012 Population Projections Report produced by ZIMSTAT in May 2019.

ZIMSTAT produces an updated set of population projections every 10 years to provide a demographic outlook of the population of Zimbabwe. The district projections do not represent Zimbabwean government policy targets or desired population outcomes nor do they incorporate explicit economic or planning assumptions. But the projections provide an indication of the future size and age structure of the population based on mid-year population estimates. They are developed using a standard demographic methodology that is the ratio method together with mathematical extrapolation. The report includes a set of detailed statistical tables on district projections. Key demographic terms are defined in a glossary.

### ***1.2 Objectives of the District Population Projections***

The main purpose of the district population projections is to present a set of population projections based on the reviewed population of the 2017 ICDS and previous census results. Specifically the projections cover the period 2012 to 2032 focusing on:

- Size and age-sex structure of the population in the four districts of Harare province by individual calendar years and 5-year age group;
- Future trends of selected target population group.

### ***1.3 Methodology***

Conducting population projections at the sub-national level such as districts is important as devolution planning is directed precisely to the design of plans and programs that consider the specific characteristics of a province and its administrative districts. The magnitude of the population in different geographic or administrative units its structure and demographic dynamic are essential inputs to regional planning exercises. It is important to point out that the results of sub-national projections are less reliable or more uncertain than those obtained at the national level.

This is mainly due to the difficulties associated with projecting internal migration. In fact this is often an important component of population growth or decline among the subdivisions of a country.

For these reasons a ratio method combined with a mathematical method was used for the projection of the district population projections. Considering the quality of the data and the uncertainties of the future this approach appears to be appropriate. The population for the districts was projected in two stages. At the first stage the total population by sex for the province was projected. The proportion of the district population in each district for each sex was calculated. Then the proportions of the districts during the projection period were estimated as linear extrapolations of the proportions observed during 1992 2002 and 2012 (census populations). The results of this extrapolation are presented in Table 1. Using these extrapolated proportions the projected population (by sex) were calculated. At the second stage the total population was disaggregated by age group. This was done by a method called iterative proportional fitting (it is also called contingency table two-way raking and square table). It iteratively adjusts columns and rows of a two-way table. This procedure was done with the programme CTBL32 of the demographic package PAS previously used to smooth the 2012 census population (AGESMTH).

#### **1.4 Limitations of the Analysis**

Accurate forecasts of population and related components of population change are utopian under any circumstances. There is no firm basis for extrapolating pertinent demographic factors and relationships which may hold in both the industrialised world and the different cultural settings of the developing countries. However the role of population projections in national development planning scenarios within the limitations of current knowledge justifies the time and effort in manipulating them.

#### **2.0 Base Population**

An essential task in the preparation of population projections by age and sex with the ratio method is the definition of a *base population*. This is the initial population of the projection which is defined for a past or present date preferably the middle of the calendar year (30 June) of a given year generally the census year. A base population was established for both provincial and district projections.
